A few months ago Tesla CEO Elon Musk referred to his company as “a technology company, not a car company.” I’m sure he didn’t intend to draw this much attention to himself, but after the community started a very intense debate with related arguments and counterarguments, this has long been my opinion as well, especially after real-world-testing the battery stamina of the Model S and X. In the end, it is hard to argue with Tesla’s battery intel. Nowhere else is the battery drained so quickly and unevenly, unless there is an external charger plugged into a wall outlet. Even so, how does one charge a Tesla battery in the first place? For the past 5-6 months, I have been testing the long-lasting battery of the Adequate Workhorse , which retails for only \$1099. Non-Tesla owners will probably balk at the price, but for a quality workhorse vehicle with a beautiful design and a highly exceptional range (285 miles for the standard long-range battery), the \$100 more is worth it. It is equally important to note, however, that the longer the battery lasts, the longer the charge lasts for recharging. As a photographer/author I have worked in creative for years, but have never used photoshop, and until the release of the iPad I never considered using photoshop. Now I’ve got to say that there are no alternatives to Photoshop on the Ipad and I think Photoshop is a must for any content creator. The software provides so much more power than Apple’s image editing apps, and has become a great tool through the years. I really can’t wait for photoshop on the iPad specifically for the large screen. I love how it allows for real time photo editing and transitions through the various image layers and panels. I never thought such a capacity would be possible on a tablet, but I’m so happy that I was able to include my Photoshop on the iPad Pro. (I’m a huge photoshop fan btw)

WebP is a new standard for lossless, web-friendly image file format. Until now, images have needed to follow a path dictated by the browser many websites and other platforms need to accommodate. In addition, design teams must often jump through hoops to ensure designs don't get left out of transitions between platforms. The WebP standard eliminates some of these challenges by offering optimized, web-friendly image file formats, resulting in more consistent file delivery and better experiences being served across platforms. With PS at the front of this revolution, we're delivering a unified file format for high-definition and low-quality images on the web. The new format enables all creative applications to work with the highest-quality, most compact versions of your images, so you can work on your high-resolution files seamlessly across desktop and mobile, without having to lose resolution and quality as designs move from app to app. A unified file format for web-ready and high-resolution images—from traditional desktop and web design, to applications like Photoshop and Illustrator, Web Assembly and beyond—means that designers can easily work on files and layers across a wide range of scenarios, ensuring collaboration is as seamless as possible. More and more apps are delivering their own image file formats—like Giphy, Medium or VSCO—to consumers, but these often lack support for the wide range of images and file types developers need to create a seamless user experience.

In this new environment, the legacy features in Photoshop will be given the very best of the CPU-based feature set in the Adobe Creative Cloud, while the native API-based features will be accelerated on native AMD GPU features of the new apps. At the moment, we are making key features of the legacy GPU-based 3D features available as native API features. For example, Photoshop Lightroom has the ability to apply lighting, layer effects and file operations to images in the same feature set as native GPU accelerated apps. The legacy 3D feature set is currently being ported, so it will be some while before every legacy feature from 3D is available in the native API version. Where supported, the legacy GPU version will be accelerated by the new technique. Premium members of the Creative Cloud Photography, Video, and Mobile plans can also expect to eventually see a timeline in Adobe's New Features and Releases for each of these products that provides a roadmap for new features and technology. By having these timelines for the individual products, and with upwards cloud-like compatibility, there should be fewer gaps in functionality. We have been working closely with Apple to enable a range of new features and APIs in the new hardware and graphics architecture. To make this happen, we needed to rewrite many of the native API parts of the app. This included freeing up the GPU of any 3D image manipulation, pushing rendering to the native GPU, and embedding 2D drawing directly into the new architecture.
