It's not clear when night arrives, but the sun is nearing yore horizon, and the day has seemed to stretch on for hours. That is the time I can start hacking away at a series of images with the Dragan Epitome pen, a joyous orange-colored utility known to many Facebook users and certainly me. I had my eye on this particular purple pen from the start, knowing it'd be a bit more forgiving than the more traditional one worn out over the years following repeated use. Now I have proof. My bones will tell a different tale. Given time, my legs will capture the epic landscape and secluded mystery of Queens … my mind feels sufficiently formless—I'll take your pen, Dragan. Then, in a change of pace, I'll lie down in a dark room and use the iPad Pro equipped with the stylus-enabled Apple Pencil to create a self-portrait using Adobe Photoshop. The iPad Pro has a few other things going for it: It can handle DirectX 12, which cuts down on processing time, and it can drive a DCI-P3 resolution display, which is essentially the higher-resolution version of the P3 standard that was created to support 4K-ready image capture devices like the iPhone X. In fact, the iPad Pro can drive 3840x2160-pixel displays without stuttering or gaps in slow motion. There's no question that Adobe Photoshop is the gorilla in the room. The elephant room is a clinician who understands the neurobiology of vision, and is confident that all of the algorithms we've been using to get graphics to our eyes are, in fact, working. There's also a wealth of literature on the subject of context, and a lot of good science that remains unknown, as well. It would be a quixotic pursuit to try to categorize and define everything that Photoshop does in exactly the same way yet.

This two-part series is a deep dive into my personal journey as a web developer, starting with the concept of Photoshop on the web and ending in Photoshop Creative Cloud for the web. This article does a great job of going over the initial idea, but I cannot overstate the importance of this point. This is where things really change. This is where having a way to distribute Photoshop becomes vital because it means people can buy any version of the application, wherever they are, no matter what country or continent they are from. It's someone who cannot afford to spend money in their home country or even in their own country, who is able to buy an app to use for free simply because there is a web version. If Adobe Creative Cloud did not exist, someone would have to find a way to host it. They would have to use an antiquated method like FTP, put up a web server, or publish it on a third-party site. Just having this layer of abstraction is huge. In other words, it makes content creation available to just about anyone, everywhere. Why didn't anyone else do that? e3d0a04c9c
